Single Incision Endoscopic Carpal Tunnel Release

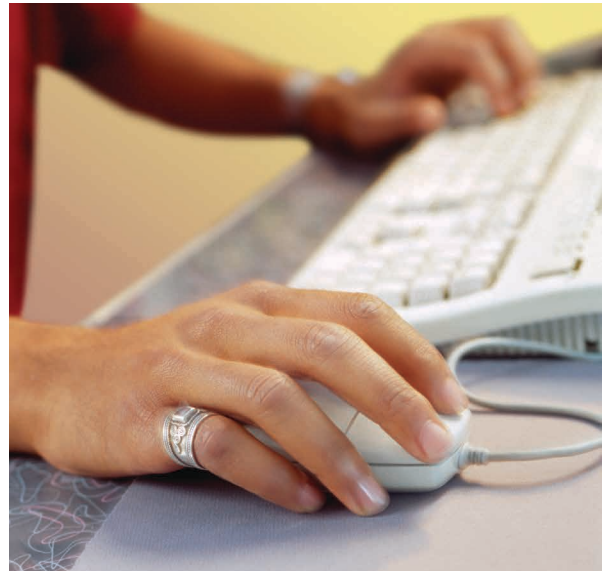

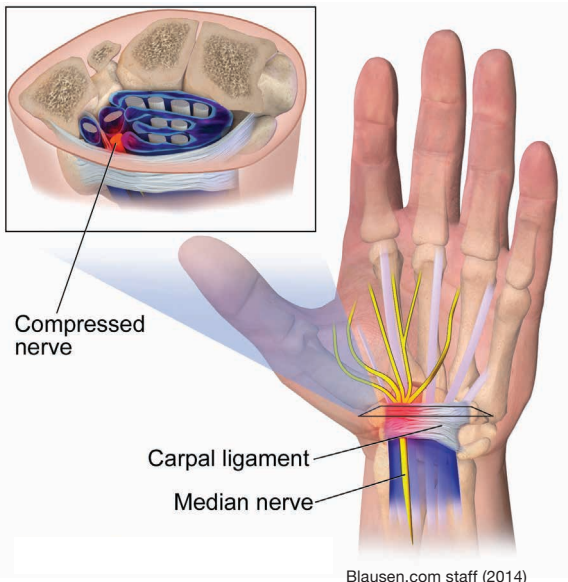

Faster Recovery with Less Pain

Dr. Nicolas Stratton offers Single Incision Carpal Tunnel Release via Endoscope.

This procedure allows the surgeon to make a single small incision at the wrist. With the help of a small camera, the procedure can be completed within minutes.

The goal of the single incision endoscopic technique is to avoid an incision on the palmar surface of the hand. As compared with open release and the two-portal endoscopic technique for release of the carpal tunnel, this single incision technique permits the patient to return to work and activities of daily living earlier as a result of less tenderness and earlier return of strength.

Santiam Orthopaedic Clinic specializes in a wide variety of orthopaedic care, sports medicine, and treatment for acute fractures.

All surgical procedures are performed at the state-of-the-art Surgical Center in Santiam Hospital. Dr. Stratton and his team provide joint replacement, knee and shoulder arthroscopic surgeries, carpal tunnel, viscosupplementation, and general orthopaedic care close to home.

Dr. Stratton received his medical degree from Irvine College of Medicine in Irvine, California, and completed his residency training at University of Southern California Department of Orthopedic Surgery in Los Angeles. He is board certified by the American Board of Orthopedic Surgery.
